

Rocks and Minerals!

Presented by UW Rockin' Out!

Earth and Space Sciences
UNIVERSITY of WASHINGTON

Sophia Robillard

- Earth Science student at the University of Washington!
- My favorite rock is fossiliferous limestone.

Yehliu Geopark, Taiwan

Reid Alexander

- Student at the University of Washington!
- My favorite rock is a Petoskey stone!

Capitol Reef National Park, UT

How do we classify rocks?

3 types of rocks:

- Sedimentary
- Igneous
- Metamorphic

Sandstone

Gneiss

Granite

Sedimentary Rocks

- Sedimentary rocks are the most common type of rocks on Earth's surface!
- May contain fossils like shells
- Can form in layers
- Deposited at the Earth's surface by wind, water, ice, or biology

Limestone

Sandstone

Igneous Rocks

- Form when molten rock like magma or lava cools and solidifies!
- Large or small crystals
- Holes where air pockets used to be
- No layering
- Hard rocks

Basalt

Obsidian

Metamorphic Rocks

- Formed by the transformation of existing rocks by heat and pressure!
- May have wavy or straight layers!
- Contain Metamorphic minerals such as garnet (red) and mica (flat and shiny)

Gneiss

How do we describe rocks?

How do we describe rocks?

- Size
- Shape
- Texture
- Angularity (sharp/round edges)
- Color
- Weight
- Hardness

The Rock Cycle Song

Hopscotch

Activity for today!

Look at the rocks in your box!

- What **colors** do you see?
- Are your rocks shiny or sparkly?
- How hard are your rocks?
- Heavy or light?
- Round or angular?
- How would you classify your rock?
(Sedimentary, Igneous, Metamorphic)

Sedimentary Rocks
